

Prtf1 Regex and OpenRefine

Author Name(s): August, Lasse, Hanna, Anne-Sophie

Task 1: List regex that extracts dates from <http://bit.ly/regexexercise2> and formats them as YYYY-MM-DD?

URL for the solution: <https://regex101.com/r/4ZteWQ/1>

Brief explanation: The regex command in the “TEST STRING” lets us find all the dates in the text. In the “SUBSTITUTION”-part, the commands lets us rearrange the dates by having year first, then month and then day. In that way, the text has now been rearranged by having the date in the right order down in the “substitution”-part as the task demanded us to do.

Task 2 Regex to convert stopwordlist between R and Voyant format

R to Voyant: <http://bit.ly/regexexercise4>

Regex101: <https://regex101.com/r/BNganq/2>

Brief explanation: After having copied in the data/text from Docs (looking like a R list style) into the “TEST STRING”, we wrote the following in the regex: The brackets tells it to look for these things inside of the brackets, then we typed in the quotation marks to have it find all quotation mark symbols, then the “backslash s” to have it find all whitespace (spaces or new lines), and then typed in a comma to also have it find all commas. With the plus at the end, it tells it to grab everything in that set if they appear together. In the “substitution” field, we have typed “backslash n” to have all words separated and replaced on a new line. Now the stopwordlist has been converted from R format to Voyant format.

Voyant to R: <http://bit.ly/regexexercise3>

Regex101: <https://regex101.com/r/8VnaSu/1>

Brief explanation: After having copied in the data/text from Excel (looking like a Voyant list style) into the “TEST STRING”, we wrote “backslash s” and “*” to have it match all whitespace before the word. Hereafter the paratheses with “backslash s” and “+” captures a sequence of non-whitespace characters, which is the word itself, into Group 1. The “backslash s” and “*” matches any whitespace after the word. Down in the “SUBSTITUTION”-part, the command “quotation mark”, “dollar-sign”, “quotation mark”, “comma”, takes the captured word and shows it with a quotation mark on each side of the word and follows it up by a comma and then with a space at the end to have some air between the words. Now the stopwordlist has been converted from Voyant format to R format.

Task 3 Does OpenRefine alter the raw data during sorting and filtering?

YES / NO

No, it does not alter the raw data when using sorting and filtering in Openrefine.

Source: <https://datacarpentry.github.io/openrefine-socialsci/03-filter-sort.html>

Go down to ”KEY POINTS” in the link to see.

Task 4: Which two months are reported as the most water-deprived/dryest by the interviewed farmer households (SAFI_openrefine.csv)?

October and September were recorded as the most water-deprived/dryest months by the interviewed farmer households. October placing highest with being counted 74 times, while September being mentioned 70 times. In order to analyze this data, we had to sort the data and remove the unnecessary spaces, apostrophe, spaces and the opening square bracket.

By using this code:

```
value.replace("[", "").replace("]", "").replace("'", "").replace(" ", "")|
```

Afterwards we isolated the data by removing the semicolon and following a ranking of the months in the system under “count”, we got the answer of October and September being the most water-deprived/dryest months.

Task 5: Challenge - 10 most common occupations among in 1801 Aarhus

Total number of people in your selected cohort:

There are 22.275 men, whom we are focusing on. There are also 36 “blanks” whose gender we do not know.

There are only 3311 men who are between the ages 20-30 years old, which we found out after going to the little arrow for the “alder”-column, went to “Edit cells”, went to “Common transforms” and chose “To number”. Then we went to “facet” and chose “Numeric facet”. Then we had an overview of all ages and by dragging/adjusting the bars on each side of the facet, we could narrow in the search to men between 20 and 30 years old.

Define what is / is not an occupation:

“Inderste”, “nyder Ophold af Gaarden”, “lever af Almissee” are examples of something that are not occupations since it is either a description of how that person is simply living or how that person is feeding on to be alive.

An occupation is when you have an actual job to attend which gives money. If you were a farmer in 1801 you would need to for instance tend the crops and later harvest them. The most common occupation in 1801 in Aarhus was being a soldier or a farmer with some owning a house and some living at a farm either owning it or helping out, while others just owned a house without land or even just resided and paid rent.

10 most frequent occupations (list number of people practising that job with each entry)

- Soldat (387)
- Bonde (154)
- Husmand (93)

- Jordløs (56)
- Indsidder (41)
- Tjener (36)
- Tjenestekarl (34)
- Væver (32)

This is the data we got from combining the different kinds of soldiers and farmers. We can therefore conclude, that the most common profession was being a soldier in some kind of form and then agriculture professions. Then comes the craftsman in and the people hired at the farm. The reason we only have 8 professions is because we combined the different kinds of professions of being a soldier, so we would get a more manageable overview over the large data set of professions.
